

## CS 3053

### Peer Evaluation of Team Project Members

*Due Friday, May 4, 2018 at 11:00pm. (There is no grade. Slack days don't apply.)*

**Name:** Hunter Black

*The purpose of this "assignment" is to help me assess the contributions made by the individual members of each project team. This will help me determine individual project grades; note that members of each team will not necessarily receive the same grade. Please answer all questions honestly. Comments are very helpful; **add space under each question as needed**. I will not share your comments with your team members.*

1. Given 100 percent total effort to spread across your group members, assign a percentage effort to each group member, including yourself.

Hunter Black (Myself):	50%
Evan Johnston:	50%

2. How often were each person's ideas or suggestions accepted by the group?

Most suggestions made by all members of our group were considered. Because of how we divided the tasks for our project, suggestions about the UI design made by myself were generally accepted, with assistive input from Evan. Ideas on the algorithm design and backend development made by Evan were generally accepted, with help from me to design in a way to fit with the UI of our project.

3. How often did each person lead the way for the group?

When coming up with how our application should look along with the UI elements of our project, I lead the way for our group. When discussing how to create and implement the backend elements of our project including the abstraction functions, Evan lead the way.

4. If any person had not been a member of your group, do you feel the group performance would have suffered? If so, in what ways and to what extent?

Yes, I feel that if either of us were not a member of our group, the other would suffer greatly in trying to complete this project with its current scope on time. This is especially true due to the smaller team size, as well as the relatively equal contribution from both of us on varying aspects of our application.

5. What were each person's strengths in contributing to the group effort?

My own strengths in terms of contribution to the project were largely UI and HCI related, as I developed the main UI of our application. Evan's strengths were in the algorithm and function development of our abstraction methods.

6. What were each person's weaknesses in contributing to the group effort?

Due to each member of our team having a larger than expected workload this semester, both of us fell short in the time commitment we planned on making for this project. For myself, I was unable to contribute as much as I would have liked in hooking up our history/undo panel with the backend of our code. For Evan, I feel that his slight unwillingness to work with the UI elements held us back in our timeline, whereas if he had spent the time to fully understand the UI and implement some of the more complicated backend features without me needing to assist him, we could have accomplished more of our goals.
